this important on proficiency testing and is essential reading for practising analytical chemists and all with an interest in the quality of analytical data

accurate modeling of the interaction between convective and diffusive processes is one of the most common challenges in the numerical approximation of partial differential equations this is partly due to the fact that numerical algorithms and the techniques used for their analysis tend to be very different in the two limiting cases of elliptic and hyperbolic equations many different ideas and approaches have been proposed in widely differing contexts to resolve the difficulties of exponential fitting compact differencing number upwinding artificial viscosity streamline diffusion petrov galerkin and evolution galerkin being some examples from the main fields of finite difference and finite element methods the main aim of this volume is to draw together all these ideas and see how they overlap and differ the reader is provided with a useful and wide ranging source of algorithmic concepts and techniques of analysis the material presented has been drawn both from theoretically oriented literature on finite differences finite volume and finite element methods and also from accounts of practical large scale computing particularly in the field of computational fluid dynamics

progress in mos integrated circuit technology is largely driven by the ability to dimensionally scale the constituent components of individual devices and their associated interconnections given a set of materials with fixed properties this scaling is finite and its predicted limits are rapidly approaching the international technology roadmap for semiconductors establishes the pace at which this scaling occurs and identifies many of the technological challenges ahead this volume assembles representatives from the fields of materials science physics electrical and chemical engineering to provide an

insightful review of current technology and understanding specifically the intent is to discuss materials issues stemming from device scaling to sub 100nm technology nodes topics include high k characterization atomic layer deposition gate metal materials and integration contacts and ultrashallow junction formation theory and modeling and crystalline oxides for gate dielectrics
