chemical principles are fundamental to the earth sciences and geoscience students increasingly require a firm grasp of basic chemistry to succeed in their studies. The enlarged third edition of this highly regarded textbook introduces the student to such geo-relevant chemistry presented in the same lucid and accessible style as earlier editions but the new edition has been strengthened in its coverage of environmental geoscience and incorporates a new chapter introducing isotope geochemistry. The book comprises three broad sections: the first chapters 1–4 deals with the basic physical chemistry of geological processes; the second chapters 5–8 introduces the wave mechanical view of the atom and explains the various types of chemical bonding that give earth materials their diverse and distinctive properties; the final chapters 9–11 survey the geologically relevant elements and isotopes and explain their formation and their abundances in the cosmos and the earth. The book concludes with an extensive glossary of terms, appendices cover basic maths, explain basic solution chemistry and list the chemical elements and the symbols, units and constants used in the book.

In combining and revising the two titles *Past Glacial Environments* and *Modern Glacial Environments* Dr Menzies provides a current and comprehensive survey of both the glaciology, geomorphology and sedimentology of glaciers.
