project report from the year 2014 in the subject computer science programming grade 95 100 san diego state university department of electrical and computer engineering language english abstract four different tasks in regard to digital signal processing are introduced and solved the code as well as the output will be given

the book discusses receiving signals that most electrical engineers detect and study the vast majority of signals could never be detected due to random additive signals known as noise that distorts them or completely overshadows them such examples include an audio signal of the pilot communicating with the ground over the engine noise or a bioengineer listening for a fetus heartbeat over the mother s the text presents the methods for extracting the desired signals

from the noise each new development includes examples and exercises that use matlab to provide the answer in graphic forms for the reader s comprehension and understanding
