the book first discusses in depth various aspects of the well known inconsistency that arises when explanatory variables in a linear regression model are measured with error despite this inconsistency the region where the true regression coefficients lie can sometimes be characterized in a useful way especially when bounds are known on the measurement error variance but also when such information is absent wage discrimination with imperfect productivity measurement is discussed as an important special case next it is shown that the inconsistency is not accidental but fundamental due to an identification problem no consistent estimators may exist at all additional information is desirable this information can be of various types one type is exact prior knowledge about functions of the parameters this leads to the cals estimator another major type is in the form of instrumental variables many aspects of this are discussed including heteroskedasticity combination of data from different sources construction of instruments from the available data and the liml estimator which is especially relevant when the instruments are weak the scope is then widened to an embedding of the regression equation with measurement error in a multiple equations setting leading to the exploratory factor

analysis efa model this marks the step from measurement error to latent variables estimation of the efa model leads to an eigenvalue problem a variety of models is reviewed that involve eigenvalue problems as their common characteristic efa is extended to confirmatory factor analysis cfa by including restrictions on the parameters of the factor analysis model and next by relating the factors to background variables these models are all structural equation models seems a very general and important class of models with the lisrel model as its best known representation encompassing almost all linear equation systems with latent variables estimation of seems can be viewed as an application of the generalized method of moments gmm gmm in general and for sem in particular is discussed at great length including the generality of gmm optimal weighting conditional moments continuous updating simulation estimation the link with the method of maximum likelihood and in particular testing and model evaluation for gmm the discussion concludes with nonlinear models the emphasis is on polynomial models and models that are nonlinear due to a filter on the dependent variables like discrete choice models or models with ordered categorical variables

the present collection of formulas has been composed for students of economics or management science at universities colleges and trade schools it contains basic knowledge in mathematics financial mathematics and statistics in a compact and clearly arranged form this volume is meant to be a reference work to be used by students of undergraduate courses together with a textbook and by researchers in need of exact statements of mathematical results people dealing with practical or applied problems should also find this collection to be an efficient and easy to use work of reference

in addition to numerous practical suggestions this volume features a variety of sample patient worksheets and appendices that detail resource materials and reading lists for both the practitioner and the client a final chapter offers guidance in progressing as a cognitive therapist
