an algebraic approach to non classical logics

this text uses the concepts usually taught in the first semester of a modern abstract algebra course to illuminate classical number theory theorems on primitive roots quadratic diophantine equations and more

this is a unified treatment of the various algebraic approaches to geometric spaces the study of algebraic curves in the complex projective plane is the natural link between linear geometry at an undergraduate level and algebraic geometry at a graduate level and it is also an important topic in geometric applications such as cryptography 380 years ago the work of fermat and descartes led us to study geometric problems using coordinates and equations today this is the most popular way of handling geometrical problems linear algebra provides an efficient tool for studying all the first degree lines planes and second degree ellipses hyperboloids geometric figures in the affine the

euclidean the hermitian and the projective contexts but recent applications of mathematics like cryptography need these notions not only in real or complex cases but also in more general settings like in spaces constructed on finite fields and of course why not also turn our attention to geometric figures of higher degrees besides all the linear aspects of geometry in their most general setting this book also describes useful algebraic tools for studying curves of arbitrary degree and investigates results as advanced as the bezout theorem the cramer paradox topological group of a cubic rational curves etc hence the book is of interest for all those who have to teach or study linear geometry affine euclidean hermitian projective it is also of great interest to those who do not want to restrict themselves to the undergraduate level of geometric figures of degree one or two

the primary object of the lecture notes is to develop a treatment of association schemes analogous to that which has been so successful in the theory of finite groups the main chapters are decomposition theory representation theory and the theory of generators tits buildings come into play when the theory of generators is developed here the buildings play the role which in group theory is played by the coxeter groups the text is intended for students as well as for researchers in algebra in particular in algebraic combinatorics

this book investigates the design of compilers for procedural languages based on the algebraic laws which these languages satisfy the particular strategy adopted is to reduce an arbitrary source program to a general normal form capable of representing an arbitrary target machine this is achieved by a series of normal form reduction theorems which are proved algebraically from the more basic laws the normal form and the related reduction theorems can then be instantiated to design compilers for distinct target machines this constitutes the main novelty of the author s approach to compilation together with the fact that the entire process is formalised within a single and uniform semantic framework of a procedural language and its algebraic laws furthermore by mechanising the approach using the obj3 term rewriting system it is shown that a prototype compiler is developed as a byproduct of its own proof of correctness

mixing elementary results and advanced methods algebraic approach to differential equations aims to accustom differential equation specialists to algebraic methods in this area of interest it presents material from a school organized by the abduS Salam international centre for theoretical physics ICTP the bibliotheca alexandrina and the international centre for pure and applied mathematics CIMPA

math for business finance an algebraic approach provides modern examples for students to understand business mathematics and make connections with real world applications the course covers mathematical concepts from an algebraic approach combined with business applications every chapter is devoted to a personal finance theme with topics that include payroll and the cost of purchasing a home there is also extensive integration of scientific calculator notation and also has the wall street journal and kiplinger news clips that have been widely popular in jeffrey slater s other two business math texts connect is the only integrated learning system that empowers students by continuously adapting to deliver precisely what they need when they need it and how they need it so that your class time is more engaging and effective
