for many years i have been interested in global analysis of nonlinear systems the original interest stemmed from the study of snap through stability and jump phenomena in structures for systems of this kind where there exist multiple stable equilibrium states or periodic motions it is important to examine the domains of attraction of these responses in the state space it was through work in this direction that the cell to cell mapping methods were introduced these methods have received considerable development in the last few years and have also been applied to some concrete problems the results look very encouraging and promising however up to now the effort of developing these methods has been by a very small number of people there was therefore a suggestion that the published material scattered now in various journal articles could perhaps be pulled together into book form thus making it more readily available to the general audience in the field of nonlinear oscillations and nonlinear dynamical systems conceivably this might facilitate getting more people interested in working on this topic on the other hand there is always a question as to whether a topic a holds enough promise for the future and b has gained enough maturity to be put into book form with regard to a only the future will tell with regard to b i believe that from the point of view of both foundation and methodology the methods are far from mature
