the seasonal performance model spm was developed to provide an accurate source of seasonal energy consumption and cost predictions for the evaluation of heat pump design options the program uses steady state heat pump performance data obtained from manufacturers or computer simulation model runs the spm was originally developed in two forms a cooling model for central air conditioners and heat pumps and a heating model for heat pumps the original models have undergone many modifications which are described to improve the accuracy of predictions and to increase flexibility for use in parametric evaluations insights are provided into the theory and construction of the major options and into the use of the available options and output variables specific investigations provide examples of the possible applications of the model

compiled edited by f william payne natural gas technologies that were new five years ago have now been tested in the real world this book describes some of these important technologies covering both new engineering concepts and new products which have emerged as well as important innovations to existing technologies many of the chapters include economic analyses which identify the resulting cost savings specific areas of development addressed include gas cooling chillers desiccant technologies cogeneration heating systems and other natural gas technologies
