evaluations of agricultural technologies rarely consider how adoption may alter the labor allocation of different household members we examine intrahousehold decision making dynamics that shape smallholder agricultural households decision to hire in mechanical rice transplanting mrt a technology that reduces demand for labor to study the adoption decision we employ an experimental approach to estimating the willingness to pay for mrt services both at the level of individual men and women within the same households as well as at the overall household level we find that women value mrt more than men but this difference in valuation is not driven by differences in their individual characteristics but primarily by differences in preferences although women value mrt more than men they have less influence over the ultimate technology adoption decision in households with women working as outside hired laborers the intrahousehold differences in mrt valuation disappear suggesting that women value mrt as a means of reallocating on farm labor to other unpaid family work labor saving mechanization such as mrt may have important implications for rural labor markets and on the gendered division of labor within agricultural households
