what even the most attentive observer of model ship events or championships might not have noticed so far is the fact that almost no model ships equipped with voith model propellers are to be seen this does not only apply to our nation the actual manufacturing country of this propulsion system but also in model building circles of other countries nothing positive is to be reported in this respect in general it seems to the author the existence of this drive is hushed up in modeling circles the reason is most likely the lack of know how this is in no way intended to cast doubt on the technical qualities of the model builders but rather to express the fact that there is still no useful documentation on model voith schneider propellers a circumstance which is to change with the construction description found in this book at this point the author would also like to dispel the widespread opinion that the voith schneider propeller is a miracle or even a witch s work and can only be understood or produced by model builders with above average technical skills with regard to production it must be said that it can be made by any reasonably technically skilled model builder

a new method of solving problems related to the geometry of a ship hull is explained this the so called parametric method possesses great universality first it enables one to construct ship design curves of water plane areas and curves of cross sectional areas in close mathematical agreement with the given geometric parameters and secondly it enables one to obtain simple and sufficiently accurate quadrature formulas for computing areas the coordinates of the centers of gravity and the moments of inertia of plane figures bounded by ship design curves for both constant and variable limits of integration the parametric method greatly simplifies the work of the designer and computer making possible a tenfold reduction in time moreover in designing the lines of the hull using the parametric method there is no longer any essential need to determine the theoretical elements of the ship s hull sections since by virtue of this method they will closely correspond to the given geometric parameters the theoretical elements for the hulls of ships designed using ordinary methods can be computed with high accuracy using the parametric method author
